

FOOD_ORDERING_BEHAVIOUR AND CONSUMER TRENDS-A STRUCTURED ANALYSIS OF CHOICES AND HABITS

CHAPTER – 01

INTRODUCTION

1.1 – Project Overview

Project Overview

The increasing popularity of online food delivery platforms and digital technologies has transformed the way people order food and make dining decisions. Consumers now have access to a wide variety of restaurants, cuisines, and delivery services through mobile applications and websites, making food ordering faster, easier, and more convenient. As customer expectations continue to evolve, understanding food ordering behaviour and consumer trends has become essential for restaurants, food delivery platforms, and businesses to improve their services and remain competitive. This project, titled **"Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits,"** aims to examine the factors that influence consumer food ordering decisions by analyzing a structured dataset. The study focuses on key aspects such as customer demographics, preferred cuisines, ordering frequency, spending patterns, payment methods, delivery preferences, and customer satisfaction. By identifying trends and behavioural patterns, the project provides meaningful insights into consumer preferences and purchasing habits. The analysis is performed using **Tableau**, where interactive dashboards, charts, and stories are developed to present the data in a clear and visually appealing manner. Additionally, **Python (Flask)** is used to integrate these dashboards into a web application, allowing users to interact with the visualizations through a simple and responsive interface. The findings of this project can help restaurants and food delivery companies understand customer needs, optimize menu offerings, improve delivery efficiency, design targeted marketing strategies, and enhance overall customer satisfaction. Furthermore, the project demonstrates the practical application of data analytics, business intelligence, and web technologies in solving real-world business problems. By converting raw data into actionable insights, this study supports data-driven decision-making and contributes to the continuous improvement of customer experience in the rapidly growing online food ordering industry.
