

FOOD_ORDERING_BEHAVIOUR AND CONSUMER TRENDS-A STRUCTURED ANALYSIS OF CHOICES AND HABITS

1.2 – Purpose of the Project

The primary purpose of this project is to understand and analyze the food ordering behaviour of consumers and identify the key trends that influence their choices and purchasing habits. With the rapid growth of online food delivery platforms and changing consumer lifestyles, food ordering has become an important part of everyday life. This project aims to examine how factors such as age, gender, income, occupation, preferred cuisine, ordering frequency, spending patterns, payment methods, delivery preferences, and customer satisfaction affect food ordering decisions. By analyzing a structured dataset, the project seeks to uncover meaningful patterns and relationships that help explain consumer behaviour and market trends. The insights generated from this analysis can assist restaurants, food delivery companies, and business managers in understanding customer preferences, improving service quality, optimizing menu offerings, and developing effective marketing strategies. The project also aims to demonstrate how data analytics and visualization tools can transform raw data into valuable business insights. Using Tableau, interactive dashboards, charts, and stories are created to present the findings in a clear and user-friendly manner, enabling stakeholders to make informed decisions based on data rather than assumptions. In addition, Python (Flask) is used to integrate the dashboards into a web application, making the analysis easily accessible through a modern and responsive interface. Another important purpose of this project is to enhance analytical, visualization, and web development skills by applying real-world data analysis techniques to a practical business problem. The study also helps identify emerging consumer trends, peak ordering times, popular cuisines, and customer spending behaviour, which can support business growth and improve customer satisfaction. Overall, this project serves as a comprehensive analysis of food ordering behaviour and consumer trends, providing actionable insights that help businesses improve operational efficiency, strengthen customer relationships, and make strategic decisions in the highly competitive online food delivery industry.
