

FOOD_ORDERING_BEHAVIOUR AND CONSUMER TRENDS A STRUCTURED ANALYSIS OF CHOICES AND HABITS

CHAPTER – II IDEATION PHASE

2.1 problem statement

The rapid expansion of online food delivery services and digital ordering platforms has significantly changed consumer food purchasing habits. Customers today have access to a wide variety of restaurants, cuisines, and delivery options, making their choices more diverse and dynamic. However, restaurants and food delivery companies often face challenges in understanding the factors that influence customer ordering behaviour, such as demographic characteristics, food preferences, ordering frequency, spending patterns, payment methods, delivery expectations, and customer satisfaction. Without a clear understanding of these factors, businesses may struggle to design effective marketing strategies, optimize menu offerings, improve delivery services, and retain customer loyalty. Additionally, the large volume of customer data generated through online food ordering platforms often remains underutilized due to the lack of proper analysis and visualization techniques. This makes it difficult for decision-makers to identify meaningful patterns, predict consumer trends, and make informed business decisions. Therefore, there is a need for a structured approach to analyze food ordering behaviour and consumer trends using data analytics and visualization tools. This project addresses this problem by examining a structured food ordering dataset to identify key consumer preferences, ordering habits, spending behaviour, preferred cuisines, and satisfaction levels. Using Tableau, the project develops interactive dashboards, charts, and stories that transform raw data into meaningful visual insights, enabling businesses to easily interpret consumer behaviour. Furthermore, Python (Flask) is used to integrate these dashboards into a web-based application, making the analysis accessible and interactive for users. The project aims to bridge the gap between raw customer data and strategic business decision-making by providing a comprehensive understanding of food ordering patterns and emerging consumer trends. The insights obtained from this analysis can help restaurants and food delivery companies improve customer experience, optimize operational efficiency,
