CHAPTER – III REQUIREMENT ANALYSIS

3.1 – Customer Journey Map

A STRUCTURED ANALYSIS OF CHOICES AND the complete experience of a consumer while using an online food ordering platform, from recognizing the need for food to providing feedback after delivery. The journey begins with the awareness stage, where customers become aware of restaurants and food delivery platforms through advertisements, social media, online reviews, recommendations from friends and family, or promotional offers. In the consideration stage, customers browse different food delivery applications or websites, compare restaurants, cuisines, menu items, prices, ratings, reviews, delivery times, and available discounts before deciding where to place an order. During the ordering stage, they select their preferred food items, customize the order if required, apply coupons or promotional codes, choose a payment method such as cash on delivery, credit/debit card, UPI, or digital wallet, and confirm the order. The next stage is order processing and delivery, where customers expect real-time order tracking, accurate preparation, hygienic packaging, timely delivery, and professional service from delivery personnel. Their satisfaction during this stage depends on food quality, delivery speed, order accuracy, and overall convenience. After receiving the order, customers enter the post-purchase stage, where they evaluate their experience based on taste, freshness, portion size, packaging quality, and whether the service met their expectations. Satisfied customers are more likely to provide positive ratings, write

favorable reviews, recommend the platform to others, and become repeat customers, while dissatisfied customers may submit complaints, request refunds, or switch to competing services. Throughout the customer journey, businesses collect valuable data on consumer preferences, ordering frequency, spending patterns, payment choices, and satisfaction levels. In this project, these interactions are analyzed using Tableau to create interactive dashboards and visual stories that reveal customer behaviour and emerging trends. The dashboards are integrated into a Python (Flask) web application, enabling users to explore the insights through an interactive interface. Understanding the customer journey helps restaurants and food delivery companies identify customer needs, eliminate pain points, improve service quality, strengthen customer relationships, and make data-driven decisions that enhance customer satisfaction and business performance in the competitive online food delivery industry.
