PROJECT TITLE	FOOD_ORDERING_BEHAVIOUR AND CONSUMER TRENDS: A STRUCTURED ANALYSIS OF ORDERS AND HABITS
MAX MARKS	2 MARKS

3.2 – Solution Requirement

The successful implementation of "Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits" requires a comprehensive solution that combines data collection, analysis, visualization, and web integration to generate meaningful business insights. The project requires a well-structured dataset containing information such as customer demographics, preferred cuisines, order frequency, spending patterns, payment methods, delivery preferences, restaurant ratings, discounts, order value, and customer satisfaction. The collected data should be accurate, complete, and properly cleaned to ensure reliable analysis and visualization. A powerful business intelligence tool, Tableau, is required to create interactive dashboards, charts, graphs, maps, and stories that effectively present consumer behaviour and food ordering trends. The project also requires Python with the Flask framework to develop a responsive web application that integrates the Tableau dashboards, allowing users to access and interact with the visualizations through a simple and user-friendly interface. A relational database or structured data files, such as Microsoft Excel or CSV, are needed to store and manage the dataset efficiently. The solution should support data preprocessing, filtering, sorting, and aggregation to improve the quality and accuracy of the analysis. The system should provide features such as interactive dashboards, dynamic filters, drill-down analysis, and responsive navigation so that users can easily explore customer preferences and ordering patterns. In addition, the solution should ensure secure handling of data, maintain data integrity, and provide a scalable architecture that can accommodate

FOOD_ORDERING_BEHAVIOUR AND CONSUMERED TRENDS: A STRUCTURED ANALYSIS OF ORDERS AND HABITS

future updates and larger datasets. The project also requires appropriate hardware and software resources, including a computer with sufficient processing power, Tableau Desktop or Tableau Public, Python, Flask, and a modern web browser for development and testing. The final solution should be capable of identifying key consumer trends, popular cuisines, peak ordering periods, spending behaviour, and customer satisfaction levels, enabling restaurants and food delivery companies to make informed, data-driven decisions. Overall, these solution requirements ensure that the project delivers an effective, interactive, and scalable platform for analyzing food ordering behaviour, improving customer experience, supporting strategic business planning, and enhancing operational efficiency in the growing online food delivery industry.
