3.3 – Data Flow Diagram

The Data Flow Diagram (DFD) represents the movement of data through the Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits project, illustrating how data is collected, processed, analyzed, and presented to users. The process begins with the data source, where food ordering information is collected from a structured dataset containing customer demographics, order details, preferred cuisines, order frequency, spending patterns, payment methods, delivery preferences, ratings, and customer feedback. This raw data is imported into the system and undergoes data preprocessing, where missing values are handled, duplicate records are removed, inconsistencies are corrected, and the data is cleaned and organized for accurate analysis. The processed data is then stored in a structured database or Excel/CSV files, which act as the central repository for the project. Next, the cleaned dataset is connected to Tableau, where the data is analyzed using filters, calculated fields, and aggregation techniques to identify consumer trends and ordering patterns. Tableau generates interactive visualizations such as bar charts, pie charts, line graphs, maps, dashboards, and stories that clearly represent customer behaviour, popular cuisines, spending habits, peak ordering times, and customer satisfaction levels. These dashboards are then integrated into a Python Flask web application, enabling users to access and interact with the visualizations through a responsive web interface. Users can apply filters, explore dashboards, and view analytical insights based on different customer attributes and ordering trends. Finally, the system

FOOD_ORDERING_BEHAVIOUR AND CONSUMERED TRENDS: A STRUCTURED ANALYSIS OF ORDERS AND HABITS

presents meaningful reports and visual summaries that support business decision-making for restaurants and food delivery companies. The outputs help stakeholders understand consumer preferences, improve marketing strategies, optimize menu planning, enhance delivery services, and increase customer satisfaction. Thus, the Data Flow Diagram demonstrates the complete flow of information—from raw data collection to data processing, visualization, web integration, and final decision-making—ensuring that the project provides accurate, interactive, and actionable insights into food ordering behaviour and consumer trends.

FOOD_ORDERING_BEHAVIOUR AND CONSUMERED TRENDS: A STRUCTURED ANALYSIS OF ORDERS AND HABITS

This DFD illustrates the overall flow of data from customer information and food ordering records, through data processing and Tableau analysis, to Flask web integration, ultimately producing interactive dashboards and business insights for decision-making.
