3.4 – Technology Stack

The Technology Stack for the project "Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits" consists of a combination of data management, business intelligence, web development, and visualization technologies that work together to analyze consumer behaviour and present meaningful insights. The project begins with a structured dataset stored in Microsoft Excel (.xlsx) or CSV format, which serves as the primary data source for analysis. Before visualization, the dataset is cleaned, organized, and validated to ensure accuracy and consistency. Tableau Desktop is the core business intelligence and data visualization tool used to create interactive worksheets, dashboards, and stories that represent customer demographics, food preferences, ordering frequency, spending patterns, payment methods, delivery performance, and customer satisfaction. Tableau enables users to apply filters, drill down into data, and explore trends through dynamic visualizations. For web integration, the project uses Python as the programming language because of its simplicity, flexibility, and strong support for data-driven applications. The Flask framework is employed to build a lightweight and responsive web application that integrates the Tableau dashboards and provides an easy-to-use interface for users. The front-end of the application is developed using HTML5, CSS3, and Bootstrap, which ensure a responsive, attractive, and mobile-friendly design. JavaScript is used to enhance user interaction and improve the functionality of web pages wherever required. Development and coding are carried out using Visual Studio Code (VS Code), while Git and GitHub can be used for version control and project management, allowing efficient collaboration and backup of source code. The project is tested and accessed using modern web browsers such as Google Chrome or Microsoft Edge.

FOOD_ORDERING_BEHAVIOUR AND CONSUMERED TRENDS: A STRUCTURED ANALYSIS OF ORDERS AND HABITS

to ensure compatibility and performance across different platforms. The minimum hardware requirements include a computer with at least an Intel Core i3 processor, 4 GB RAM, 500 GB storage, and a stable internet connection for publishing or accessing Tableau dashboards online. Together, these technologies provide a reliable, scalable, and user-friendly platform for collecting, analyzing, visualizing, and presenting food ordering behaviour and consumer trends. The technology stack enables the project to deliver accurate data analysis, interactive dashboards, seamless web integration, and valuable business insights that support informed decision-making in the online food delivery industry.
