CHAPTER – IV PROJECT DESIGN

4.1 – Problem Solution Fit

The Problem–Solution Fit for the project "Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits" focuses on addressing the challenges faced by restaurants and online food delivery platforms in understanding customer preferences and ordering patterns. With the increasing popularity of digital food ordering services, businesses collect large amounts of customer data but often struggle to transform this information into meaningful insights. As a result, they face difficulties in identifying popular cuisines, understanding spending behaviour, predicting customer preferences, improving delivery performance, and designing effective marketing strategies. These challenges can lead to poor customer engagement, reduced satisfaction, inefficient business decisions, and loss of competitive advantage. To solve these problems, this project provides a structured data analytics solution that collects, cleans, and analyzes food ordering data using modern business intelligence techniques. The project utilizes Tableau to create interactive dashboards, charts, and stories that clearly visualize customer demographics, ordering frequency, preferred cuisines, payment methods, delivery preferences, spending patterns, and customer satisfaction levels. These visualizations enable businesses to quickly identify trends, compare performance, and make informed decisions based on real-time insights. To improve accessibility and user experience, the Tableau dashboards are integrated into a Python Flask web application, allowing users to interact with the reports through a simple and

FOOD_ORDERING_BEHAVIOUR AND CONSUMERED TRENDS: A STUCTURED ANALYSIS OF ORDERS AND HABITS

responsive interface. The solution also supports filtering, drill-down analysis, and dynamic reporting, making it easier for stakeholders to explore data from different perspectives. By converting raw customer data into actionable business intelligence, the project helps restaurants and food delivery companies optimize menu planning, improve delivery services, personalize promotional campaigns, enhance customer satisfaction, and increase customer retention. Furthermore, the solution supports strategic planning by enabling businesses to monitor changing consumer trends and respond effectively to market demands. Overall, the proposed solution directly addresses the identified business problems by providing an efficient, scalable, and data-driven platform that bridges the gap between customer data and business decision-making. This strong alignment between the existing challenges and the proposed analytical solution demonstrates an effective Problem–Solution Fit, ensuring that the project delivers practical value and contributes to improved operational efficiency, customer experience, and long-term business growth in the online food ordering industry.
