4.2 – Proposed Solution

The proposed solution for "Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits" is to develop a comprehensive data analytics and visualization system that helps restaurants and online food delivery platforms understand customer behaviour, identify market trends, and make informed business decisions. The solution begins by collecting a structured dataset containing information such as customer demographics, preferred cuisines, order frequency, spending patterns, payment methods, delivery preferences, restaurant ratings, discounts, and customer feedback. The data is cleaned and preprocessed to remove inconsistencies, missing values, and duplicate records, ensuring high-quality and reliable analysis. The processed data is then analyzed using Tableau, where interactive worksheets, dashboards, and stories are created to visualize key performance indicators and consumer trends. These visualizations provide clear insights into popular food categories, peak ordering times, customer spending behaviour, delivery performance, and satisfaction levels, enabling businesses to quickly identify patterns and opportunities for improvement. To make the analytical reports easily accessible, the Tableau dashboards are integrated into a Python Flask web application that offers a responsive and user-friendly interface. Users can interact with the dashboards through filters, drill-down options, and dynamic reports, allowing them to explore data based on specific customer groups, cuisines, payment methods, or time periods. The proposed solution also supports efficient business decision-making by helping organizations optimize menu planning, improve delivery operations, personalize promotional campaigns, and enhance customer engagement. In

addition, the system provides a scalable framework that can accommodate future datasets and additional analytical features as business requirements evolve. By combining data preprocessing, business intelligence, interactive visualization, and web integration into a single platform, the proposed solution transforms raw food ordering data into meaningful insights that support strategic planning and operational excellence. Overall, this solution provides an effective, reliable, and technology-driven approach to understanding food ordering behaviour and consumer trends, enabling restaurants and food delivery companies to improve customer satisfaction, increase operational efficiency, strengthen customer loyalty, and achieve sustainable growth in the competitive online food delivery industry.
