5.2 – Sprint Delivery Plan

The Sprint Delivery Plan for the project "Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits" follows an Agile development approach, where the project is divided into manageable sprints to ensure timely delivery, continuous improvement, and regular progress evaluation. Sprint 1 focuses on project initiation, requirement gathering, problem analysis, objective definition, and collection of the food ordering dataset. During this sprint, the project scope, software requirements, and development environment are finalized. Sprint 2 is dedicated to data preprocessing, where the dataset is cleaned by removing duplicate records, handling missing values, correcting inconsistencies, and organizing the data into a structured format suitable for analysis. Sprint 3 concentrates on data visualization using Tableau, where multiple worksheets are created to analysis customer demographics, preferred cuisines, ordering frequency, spending patterns, payment methods, delivery preferences, and customer satisfaction. These worksheets are combined into interactive dashboards and stories that provide meaningful insights into consumer behaviour and market trends. Sprint 4 focuses on developing the web application using Python and the Flask framework. During this phase, the Tableau dashboards are integrated into a responsive website, and the user interface is designed using HTML, CSS, Bootstrap, and JavaScript to ensure an attractive and user-friendly experience. Sprint 5 is dedicated to system testing, validation, and optimization, where the dashboards and web application are tested for functionality, accuracy, responsiveness, and performance. Any identified issues are corrected to ensure the system operates efficiently and reliably. Sprint 6

FOOD_ORDERING_BEHAVIOUR AND CONSUMER TRENDS: A STRUCTURED ANALYSIS OF ORDER AND HABITS

focuses on final deployment, documentation, and project presentation. The complete project is reviewed, all documentation is prepared, dashboards and web integration are finalized, and the project is demonstrated to stakeholders or evaluators. Each sprint concludes with a review of completed tasks, feedback collection, and planning for the next sprint, ensuring continuous improvement throughout the development process. This structured sprint delivery plan enables the project team to efficiently manage development activities, monitor progress, reduce risks, and deliver a high-quality analytical solution that provides valuable insights into food ordering behaviour and consumer trends while supporting informed business decision-making in the online food delivery industry.
